

GIFTANATOR

FUZZY-LOGIC GIFT GENIE ENHANCING THE HUMAN ART OF GIFT-GIVING

Mid-term presentation in Fuzzy Sets and Systems I

Fribourg, 25.10.2024

ABSTRACT

The Fuzzy Giftanator is a Python-based game with two buttons. With fuzzy logic used in both, users enter as guests and choose one option. There, personalized gift suggestions are offered, as well as the possibility to play a fun guessing mini-game. Inspired by the popular genie-game Akinator, after clicking the first button users can input recipient details like closeness, occasion, and budget through a series of questions, so they can get tailored gift ideas. The second button is a guessing game that reveals a mystery gift through progressive clues and guesses by the user. The idea is to capture the excitement behind meaningful gift-giving in our real world.

Play as a Guest

ELABORATING ON THE PAINS

- Ever felt like you can't choose the right present for an occasion of someone really close to you? Choosing the right gift is often a complex and stressful process.
- Factors like personal preferences, relationships, and occasion importance create uncertainty.
- Current solutions often suggest generic gifts, with an exact budget number and crispy choices, lacking the personal touch that makes a gift meaningful.
- There always have been some type of emotion in humans when a gift is to be given or received. Unfortunately, today's technology can sometimes be exhausting, it can kill our creativity and isolate us further away from nature, so we totally forget about the real world of occasions and gift-giving as they once happened.

GOALS

- Create a personalized gift suggestion system that mimics human nature of gifting using fuzzy logic in every decision.
- Incorporate multiple factors like relationship closeness, occasion, and preferences, and treat them with degrees rather than absolutes.
- Gamify the experience with an interactive gift-guessing game, adding an element of fun.
- Develop a system that adapts to the standards of real-life gifting decisions and awaken the people with the thrill of receiving gifts and unboxing them.

THE PROGRESS SO FAR...

(Python code)

I need gift ideas, Mr. Giftanator!

Guess the gift

ASK US ANYTHING / GIFTANATOR'S RESPONSES

We Talked To

❑ Gunakar: How do you evaluate gift suggestions?

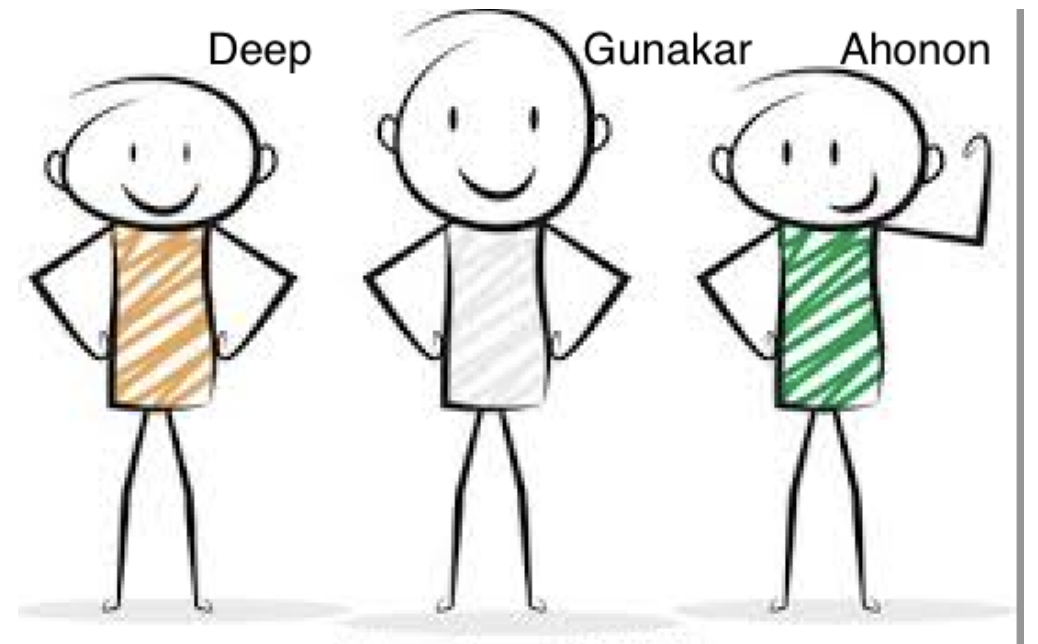

- Feedback from users (Reinforcement Learning with Human Feedback)
- Time spent on the platform
- Return rate of users for suggestions

❑ Gobi: How do you keep up with current trends?

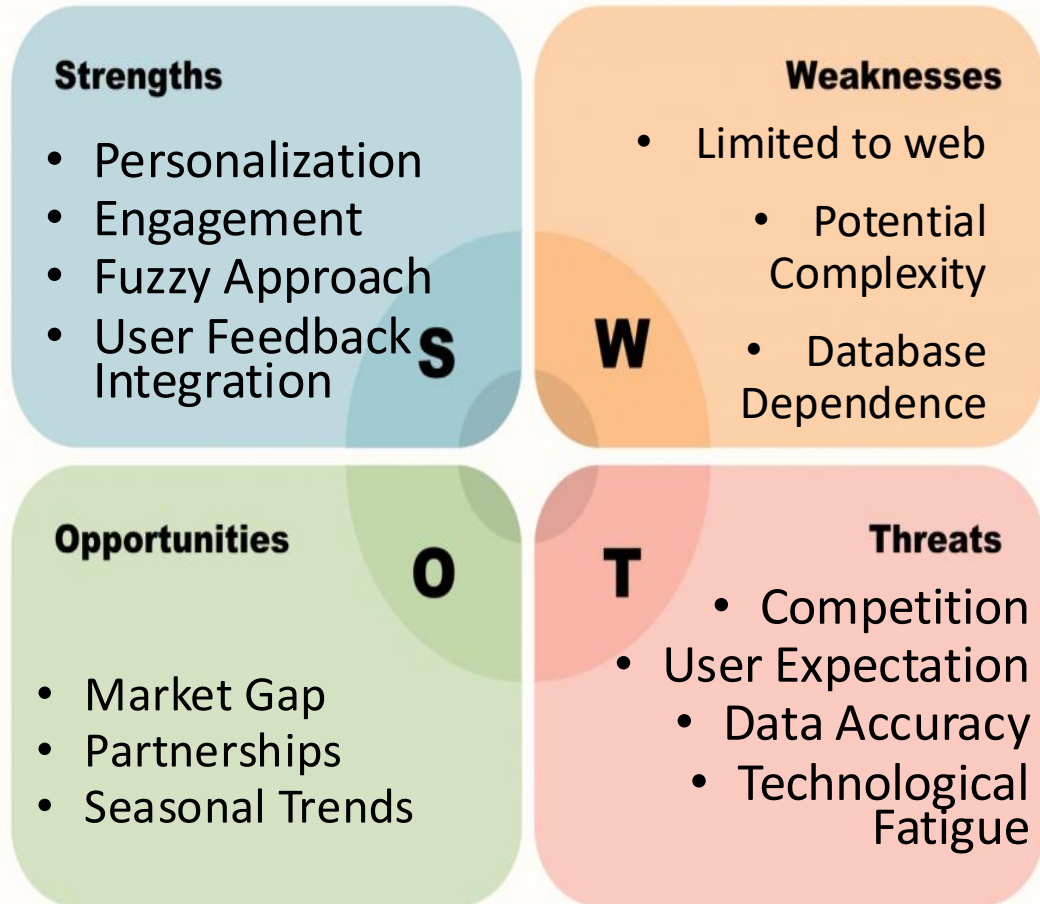

- Regularly update the database with the latest products (e.g., using Google search suggestions)

❑ Deep: Is a mobile app suitable for gifting, and how do you handle disliked suggestions?

- Web app preferred, since the usage is occasional
- Users can click on “re-suggest” and answer more questions for better suggestions

SWOT Analysis

Next Steps

- Brainstorm on which models can use the fuzzy functionality and provide suggestions in the most human-like way.
- Brainstorm on what could be the best way to make the users engage with the platform, basically what can we offer so that the user is intrigued to use the platform again.
- Design the main components of the application and build a prototype.
- Produce a demo where we can experience the whole journey of the application.

CONCLUSION

The Fuzzy Giftanator bridges the gap between traditional and technology-driven gifting, offering a smart, personalized approach. Through fuzzy logic, we aim to make gift selection less stressful and more enjoyable. With the added fun of a guessing game, our app enhances both the human-decision process and user engagement.
